# **Automation of Flex Building and Unit Testing or Continuous Integration with Flex, FlexUnit, and Ant**

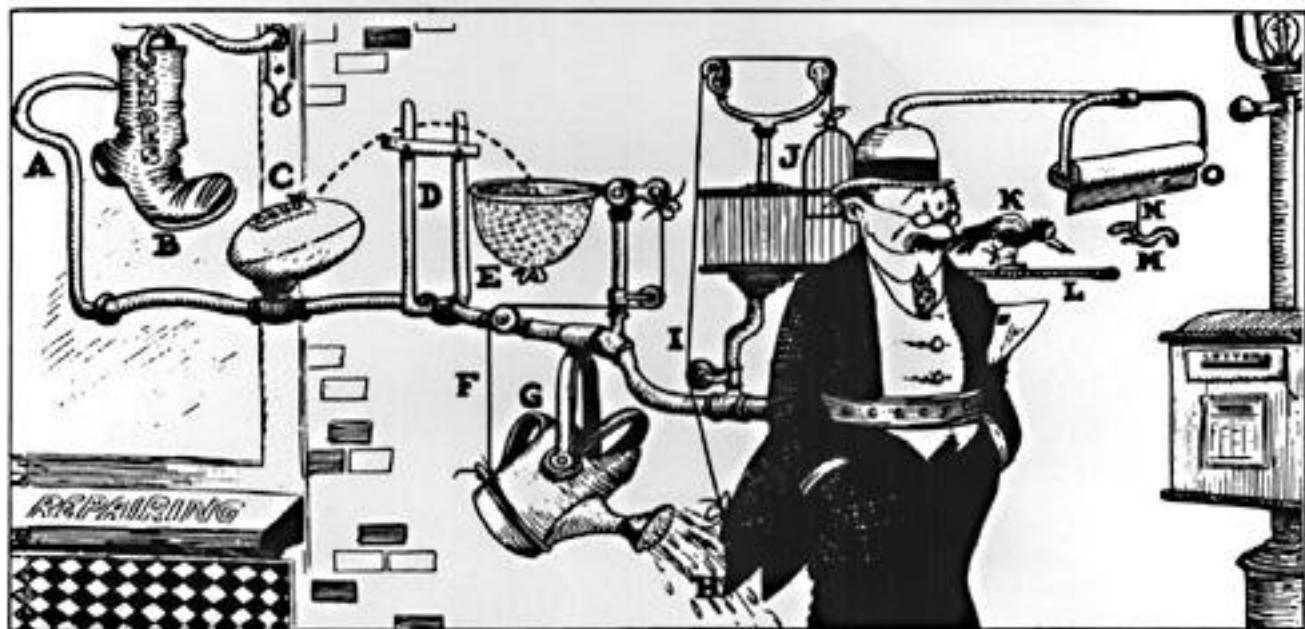

Daniel Rinehart

Software Architect

Allurent, Inc.

Is your build process like a Rube Goldberg contraption?

- Manual
- Fragile
- Missing

Keep You From Forgetting To Mail Your Wife's Letter RUBE GOLDBERG (tm) RGI 049

Goal of this talk is to introduce tools and techniques to create a continuous integration based build process.

- Centralized
- Automated
- Self-Testing

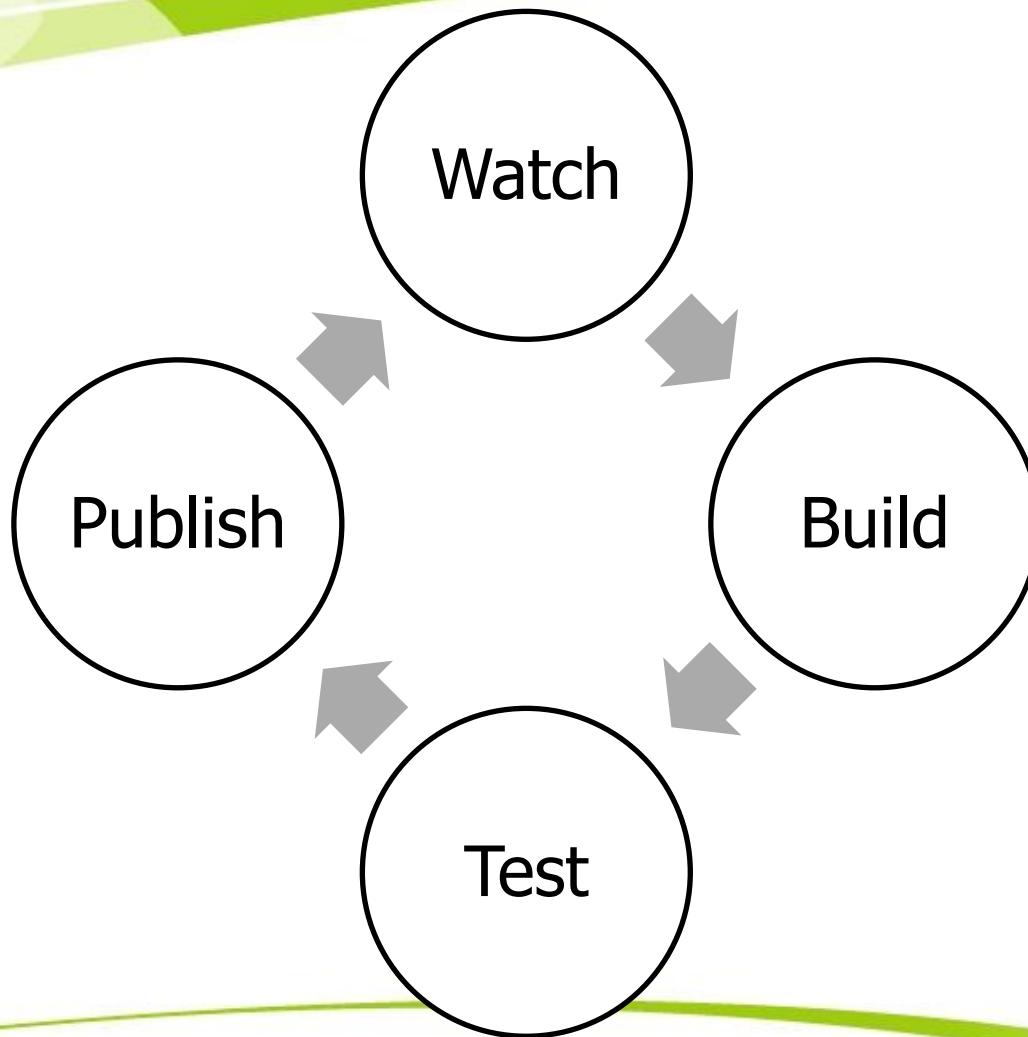

# Continuous Integration

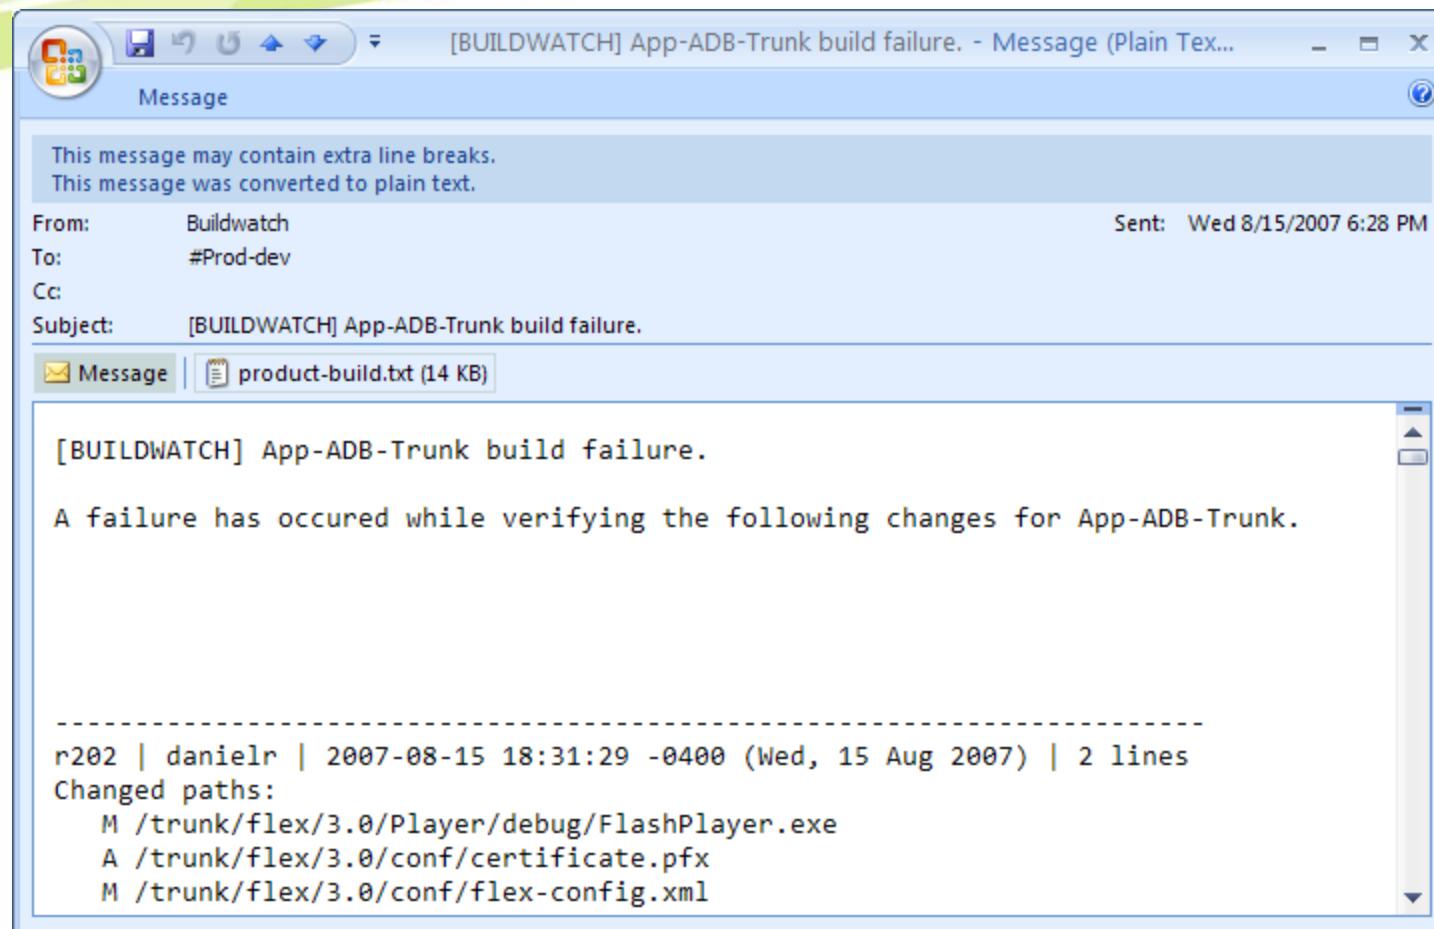

**Continuous Integration** is a software development practice where members of a team **integrate** their work frequently.

Each integration is verified by an **automated** build and test that detects integration errors as quickly as possible.

# Continuous Integration Cycle

# Build Failure Notification

## Allurent Buildwatch

Buildwatch is a continuous build system used to help quickly detect product regressions. Every 5 minutes it checks for code changes and, if a change exists, it re-builds the product and runs all junit and flexunit tests.

Alert email is sent if a failure is encountered in any steps.

For more information see the [Buildwatch wiki page](#)

### Current Status

Description	Status	Last Build Time	Platform
<a href="#">App-ADB-Trunk</a>	PASS	09/16 05:27 PM	Linux 2.6.9-42.ELsmp
<a href="#">App-Client-Trunk</a>	FAIL	09/17 12:19 PM	Linux 2.4.21-32.0.1.ELsmp
<a href="#">App-Trunk-PlatformDist</a>	PASS	09/14 03:46 PM	Linux 2.4.21-32.0.1.ELsmp
<a href="#">App-Test-Trunk</a>	PASS	09/16 07:31 PM	Linux 2.6.11-1.14_FC3
<a href="#">ArcSuite-Trunk</a>	PASS	09/14 10:00 AM	Linux 2.4.21-32.0.1.ELsmp

### Key

Product builds successfully and there are no test failures.

Product builds successfully, but there are test failures.

Product does not build successfully.

## Allurent Release Engineering

\* Active nightly builds.

# Continuous Integration Cycle

## Build Automation Tool

- Widely Used
- Extensive Documentation
- Cross Platform
- Robust
- XML Based

## Project

- Root element of a build file
- Defines steps of build process
- Ideally one-to-one correspondence to real projects

## Target

- Logical chunk of work
- Can depend on other targets
- Works like a script

## Property

- Holds a constant textual value or file location
- Accessed with \${} syntax
- Environment or custom defined

## Task

- Individual command
- Accepts arguments to control behavior
- Used in targets

# Ant Hello World Demonstration

# Hello World Build Script

```
<project name="HelloWorld" default="build">  
    <property name="message" value="Hello World!" />  
    <target name="init" description="Initialize the build">  
        <tstamp/>  
    </target>  
    <target name="build" depends="init"  
        description="Build the Hello World project">  
        <echo message="${message} Today is ${TODAY}" />  
    </target>  
</project>
```

# Hello World Build Script Output

Executed build file	Buildfile: build.xml
Name of target being run	init:
Name of target being run	build:
Task name and output	[echo] Hello World! Today is September 17 2007
Result of the build	BUILD SUCCESSFUL
Diagnostic information	Total time: 0 seconds

# Ant mxmlc Demonstration

# Compiling an Application

```
<!-- Using the Flex Ant Tasks provided by Adobe Labs -->

<project name="SampleApplication" default="build">

    <taskdef resource="flexTasks.tasks"
        classpath="${basedir}/flexTasks/lib/flexTasks.jar"/>

    <property name="FLEX_HOME" value="C:/Talk/Flex2.0.1HF2"/>

    <target name="build">

        <mxmlc file="src/${ant.project.name}.mxml"
            output="bin/${ant.project.name}.swf">

            <load-config
                filename="${FLEX_HOME}/frameworks/flex-config.xml"/>

            <source-path path-element="${FLEX_HOME}/frameworks"/>

        </mxmlc>
    </target>
</project>
```

- Keep source and output separated
- Don't do work you've already done
- Provide reasonable defaults
- Centralize behavior
- Predictability

## Build Templates

- Encapsulates Best Practices
- Handles Flex Applications, Libraries, and Documentation
- Cross Project Dependencies
- Multiple Project Builds

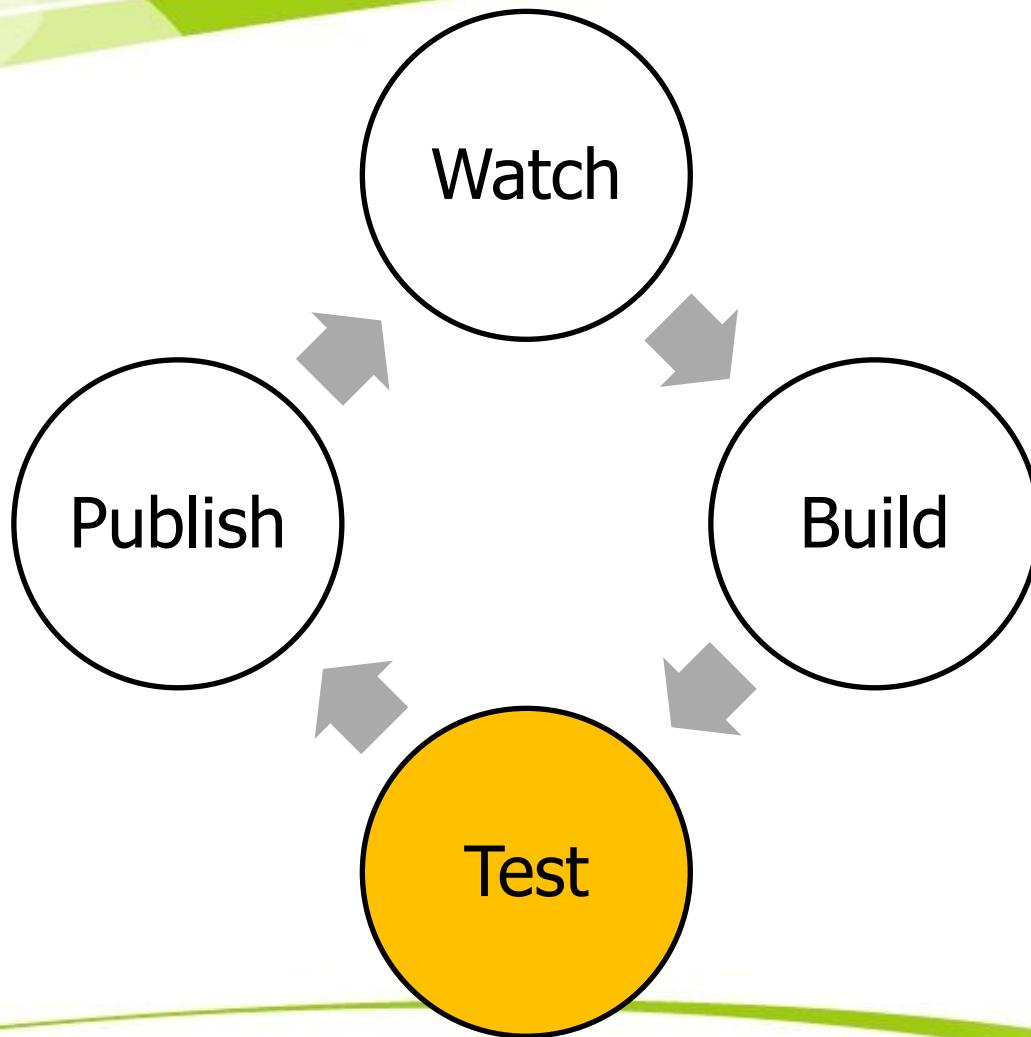

# Antennae Demonstration

# Antennae Build Script

```
<project name="SampleApplication" default="build">  
    <property name="root.dir" location=". . . /" />  
    <property file="${root.dir}/build-user.properties" />  
    <import file="${root.dir}/tools/build-imports.xml" />  
    <path id="flex2.lib.path" />  
    <target name="build" depends="init, flex2-application"  
        description="Build the application" />  
</project>
```

# Continuous Integration Cycle

## Build Verification

- Supports Flex and ActionScript
- Asynchronous Testing Facilities
- Graphical Test Results

# FlexUnit Test Results

Adobe Flash Player 9
